

## channels wont download and cannot resolve dns name

Posted by a7mag3ddon - 29 Sep 2019 17:43

---

Been a while since i used catcher but tried it today on my new ISP and i when i choose update channels lists it doesnt and then every single server comes up in red with this error.

```
*** Terminated: Couldn't resolve DNS name. Aborted (irc.ultra-xero.net) ()
```

no idea why.

Same Problem I can't get the servers and channels list to update anymore. I would appreciate it if someone can just send me one of the older servers.ini etc.. files I used to have an older server and channel list file saved can't remember which file it was which makes it kind of hard for me to look for it. I had my 3 TB drive crash and it was a total loss!

I did have a backup .ini file but because its so old most of the servers do not connect, we need a new one thats current but im not sure where to get one.

After a little investigation it looks like the sites that catcher used to extrapolate the servers list is no longer there and thats why you end up with no channels/ servers after you try and update.

Klipper current list?

Hope this helps.
